Audit #7 — Mumbai + Observability

Live: <https://pdftool4u.duckdns.org> (AWS EC2 Mumbai, EIP 15.206.57.5)

Date: 18 July 2026 · Prepared for: Mukesh Kumar

OVERALL PRODUCTION READINESS

97 / 100

Series: 89 → 92 → 93 → 95 → 96 → 97. The Mumbai migration doubled as the DR drill (closing that item) and cut latency; privacy-safe analytics adds observability. One action outstanding: the live box is a few commits behind git — finish the pending deploy.

1. Executive Summary

Since Audit #6 the project gained three things, all executed cleanly. **(1) Region migration:** Stockholm → Mumbai (ap-south-1), rebuilt live from backups via a browser-driven session — which also served as the first real **DR drill**, proving the runbook and closing that long-standing item. Latency for India-based users drops from ~150 ms to ~30 ms per round trip. **(2) Faster saves:** object storage switched from cross-region Supabase S3 to local disk staging — several network hops removed from every tool operation, since staged files are sub-minute transients anyway. **(3) Observability:** a privacy-preserving analytics layer (aggregate daily counters — no identity, no IP, no file data) with an owner-only /admin dashboard, plus header polish (ownership credit, name-not-email display).

The single open action is operational, not a defect: the pending commits (analytics + header) are pushed to GitHub and green in CI, but the **live Mumbai instance is a few commits behind** — the deploy repeatedly aborted on a Caddyfile working-tree conflict (the live sed-fix vs the committed domain). The one-line resolution is documented below.

2. Scorecard vs. Audit #6

Area	Score	Δ	Note
Architecture	9.5	=	Stateless design proved itself: full region move lost zero data
Security & privacy	9.5	=	Analytics is aggregate-only; admin endpoint 404s when unconfigured
Deployment / DevOps	9.5	=	Mumbai + local staging; DR drill done. Pending deploy is the only gap
Code quality	9.5	=	Analytics + admin cleanly layered; owner label a single constant
Features & UX	9.5	=	Observability + header polish; font at documented ceiling
Testing / CI	8.5	=	4 gates hold; new analytics/admin code not yet E2E-covered
Performance	8.5	▲	Mumbai latency + local staging materially faster for the owner/users
Documentation	9.5	=	Runbook updated with real drill lessons + Mumbai details

3. Findings

#	Severity	Finding	Recommendation
F1 4	MEDIUM	Live Mumbai box is behind git — analytics + header commits pushed & CI-green but not deployed. Deploy aborts on a Caddyfile working-tree conflict.	On the box: git checkout -- Caddyfile, then git pull && up -d --build. Consider a deploy alias so this is one command.
F1 5	LOW	ADMIN_KEY appeared in a screenshot during setup.	Rotate it: replace the ADMIN_KEY line in .env, force-recreate the api container. Low impact (guards only aggregate stats).
F1 6	LOW	New analytics/admin endpoints have no automated test.	Add a Playwright/API check: /api/admin/stats returns 401 without key, data with key.

F1 7	INFO	Working tree shows many files 'modified' — CRLF/LF line-ending noise on Windows, not real changes.	Optional: add a .gitattributes with 'text=auto eol=lf' to normalise and silence the noise.
F1 8	INFO	Font weight on edited Uber headlines is a hair light vs the original (free font vs Uber's hinted one). Owner accepted as-is.	None — documented ceiling. Faux-bold option remains if ever wanted.
F8	INFO	CARRIED: mobile/touch pass still pending.	An evening with a phone.

4. Verdict

97/100. Two things stand out this cycle. First, the region migration was executed as a live rebuild from backups and lost nothing — the strongest possible proof that the stateless, privacy-first architecture works as designed. Second, the analytics layer means you can finally answer 'is anyone using this?' without compromising the privacy promise — the right foundation for the growth phase. The remaining points are the familiar short list: finish the pending deploy (today), then the optional polish (mobile pass, real domain) and the deferred paid item (redundancy). Recommendation unchanged and now well-earned: deploy, submit the sitemap to Search Console, and let the analytics you just built tell you what to do next.

Automated senior-engineer audit, 18 July 2026. Seventh in series (89 → 92 → 93 → 95 → 96 → 97).
