Audit #5 — Closure Audit

Live: <https://pdftool4u.duckdns.org> (AWS EC2, Elastic IP 13.50.135.60)

Date: 16 July 2026 · Prepared for: Mukesh Kumar

OVERALL PRODUCTION READINESS

95 / 100

Series: 89 → 92 → 93 → 95. Every actionable finding from Audits #2–#4 is now closed and verified. The remaining 5 points are structural (single-instance economics) and minor polish, not defects.

1. Executive Summary

This audit closes the series. The operational sweep requested after Audit #4 was executed in full, and — for the first time — **every carried finding is resolved**. The gap between the product's quality (excellent since Audit #3) and its operational discipline (lagging since Audit #2) is gone.

Verification performed for this audit: the live site fully served the /help page through the new Elastic IP (cache-busted request, complete render — DNS, Caddy TLS and both containers healthy); both containers report the unprivileged node user at runtime; the sitemap and robots routes are present in the production build; the E2E browser gate ran green and was promoted to blocking; the owner confirmed the Render suspension in the provider dashboard.

2. Findings Closed This Cycle

#	Finding (origin)	Resolution — verified
F1	Old Render deployment publicly serving the pre-privacy build (Audit #2, HIGH; carried 3 audits)	Both services suspended; owner-confirmed in dashboard
F2	Containers ran as root (Audit #2)	USER node in both images; whoami verified live on the box
F3	Dead activity-logging toggle (Audit #3)	Removed; replaced with an accurate Privacy card
F5	No E2E coverage (Audit #2)	Playwright smoke suite (guest→upload→viewer→library in real Chromium); green first run; now a blocking CI gate
F6	No Elastic IP — stop/start broke DNS (Audit #2)	13.50.135.60 allocated + associated; DuckDNS repointed (after catching a private-IP mix-up); site verified live
F7	No sitemap/robots (Audit #3)	Next metadata routes live; /help priority 1, app surfaces excluded

3. Scorecard

Area	Score	Δ	Note
Architecture	9.5	=	Privacy-first design; stateless, rebuildable instance
Security & privacy	9.5	▲	Non-root runtime closes the last code-level item; secrets rotated; old deployment dead
Deployment / DevOps	9.5	▲▲	Stable IP, monitoring, suspension verified — ops debt cleared
Code quality	9.0	=	Clean layering maintained through rapid feature cycles
Features & UX	9.5	=	Editor at practical fidelity ceiling; complete tool set
Testing / CI	8.5	▲	4 blocking gates incl. real-browser E2E; unit + integration + build + journey
Performance	8.0	=	Adequate at scale; 1 GB instance remains the growth lever
Documentation	9.5	=	Current docs, help guide, 5-audit paper trail

4. What Remains (and why it doesn't block)

- **Structural (-3):** single instance, no redundancy, 1 GB RAM. Inherent to the free-tier economics; the stateless design makes recovery a rebuild, not a rescue. Revisit only if usage grows or uptime requirements harden.
- **F4 — lockfile (LOW):** builds resolve dependencies fresh. Deliberately deferred: a Linux-committed lockfile breaks Windows-based development (npm/cli#4828). Reasonable trade-off; revisit if a supply-chain guarantee is ever required.
- **F8 — mobile pass (INFO):** desktop-verified only; resize handles need a touch test.
- **Growth items:** Search Console submission, offline PWA, opt-in AI features — opportunities, not gaps.

5. Verdict

95/100 — this is what finished looks like for this deployment class. Over five audits the project went from a 60%-ready prototype on a sleeping free tier to a hardened, monitored, privacy-differentiated product on owned infrastructure, with a paper trail proving every step. The last points on the table belong to a different product tier (redundant infrastructure, paid hosting), not to unfinished work.

Recommendation: stop auditing, start growing — submit the sitemap, watch real users on the monitoring you built, and let their behavior pick the next feature.

Automated senior-engineer audit, 16 July 2026. Fifth and closing audit of the series (89 → 92 → 93 → 95).
